

# Using Lua $\text{\LaTeX}$ to typeset RTL text with reledpar

## Abstract

This file provides an example on how to use reledpar and Lua $\text{\LaTeX}$  to typeset a right to left text with its translation on the facing page<sup>1</sup>.

As you can see, the switch to RTL convention is made *before* the `pstart`. It must be also called inside `\eledsection`.

For an example with X $\text{\LaTeX}$ , look at parallel-column-two-languages.tex file.
